● Compatibility testing, ad hoc testing, exploratory testing, regression testing, acceptance testing, performance testing
● Identified system scenarios and written test cases for each module.
● Carry out regression testing every time when changes are made to the code to fix defects.

Webethics **Sahibzada Ajit Singh Nagar, Punjab**
Quality Assurance Executive October 2015 - May 2016

Website- http://www.blogdash.com

BlogDash has been helping brands and bloggers connect since 2011.

Focusing on open communication and building real relationships, we created an easy-to-use Blogger Outreach Software platform to streamline communication between PR agencies/brands and bloggers.

We, like you, have performed blogger outreach for a long time. We know a lot of time is involved in finding appropriate bloggers, gathering information, engaging with them and finally pitching them. Our mission has been to simplify this process and turn blogger outreach into a viable PR mechanism for any brand.

Bloggers have the power of influence over many market segments for just about any product or service. Through their rapport with their readers, they can command a mass migration toward your brand, or a mass exodus away from it. Blogger outreach gives you the opportunity to tap into that rapport and bring your brand positive attention from those who matter most. 99% of the time, these bloggers are open to receiving targeted and valuable opportunities and will pass them on to their audience in the blogosphere as well as through social media.

The problem is that there hasn't been an easy way for brands to determine a blogger's willingness to review and perhaps promote a product or service. With BlogDash, you can be sure that both you and your target bloggers are on the same page from engagement to article posting.

Role/Responsibility
● Performed smoke testing, functional testing, integration testing, system testing,
● Compatibility testing, ad hoc testing, exploratory testing, regression testing, acceptance testing, performance testing
● Identified system scenarios and written test cases for each module.
● Carry out regression testing every time when changes are made to the code to fix defects.
